

Bookmarker

Simple script to open up a buku bookmark

How to use

compile number.c and add the program to path

run mark.sh to run the script

type in the search tag and pick the option from fzf and it should open up the bookmark

How it can be used

I run this by adding having it in a hotkey in sxhkd (a hotkey daemon) and make it open in an alacritty window with the window class of bookmarker where I have a rule setup in bspwm to open it is a floating window

Dependencies

- buku
- fzf
- C-compiler (not optimal but I don't know how to do it without the program)
